a common blowpipe. b c shn a blowpipe in use with charcoal near the jet

the flame of a lamp, candle, or gas-jet, to direct the flame upon a substance, in order to fuse it, an intense heat being created by the rapid supply of oxygen and the concentration of the flame upon a small area.

In its simplest form, as used, for example, by gas fitters, it is merely a conical tube of brass, glass or other substance, usually about 7 inches long, 1 inch in diameter at one end, and tapering so as to have a very small aperture at the other, within 2 inches or so of which it is bent nearly at a right angle. The blowpipe of the mineralogist is provided with a small chamber near the jet, in which the moisture from the mouth collects. The current of air is often formed by a pair of bellows in stead of the human breath, the instrument being fixed in a proper frame for the purpose. The most powerful blowpipe is the oxyhydrogen or compound blowpipe, an instrument in which oxygen and hydrogen (in the proportions necessary for their combination) propelled by hydrostatic or other pressure, and coming from separate reservoirs, are made to form a united current in a capillary orifice at the moment when they are kindled. The heat produced is such as to consume the diamond and to fuse or vaporize many substances refractory at lower temperatures. The blowpipe is used by goldsmiths and jewelers in soldering, by glass blowers in softening and shaping glass, and extensively by chemists and mineralogists in testing the nature and composition of substances. Also called by workmen a *blowing iron*.

The "Magnalia" has great merits, it has also fatal defects. In its mighty chaos of fables and blunders and misrepresentations are of course lodged many single facts of the utmost value. M. C. Tyler, Hist. Amer. Lit., II, 88

—Syn. Error, Mistake, Blunder, Bull. An error is a wandering from truth, primarily in imagination, judgment, or calculation, and, by extension of the idea, in conduct, it may be a state. A mistake is a false judgment or choice, it does not as error sometimes does, imply moral obliquity, the defect being placed wholly in the wisdom of the actor, and in its treatment of this defect the word is altogether gentle. Blunder is a strong word for a mistake which is stupid, a gross error in action or speech. A bull is a blunder in language, involving generally a very obvious and comical contradiction, but the word is sometimes applied to any particularly inept or ludicrously inappropriate remark

spring. The male is about 7½ inches long, black, with a buff nape, and much white or pale ash on the back and wings; the tail feathers are very acute. The female is smaller, yellowish, darker above, and streaked. The

male wears the black livery only in the breeding season, and is only then in song. He molts in midsummer or in August, acquiring a plumage like that of the female. Both sexes are then known as *reed birds* in the Middle States, as *rice birds* in the Southern States, and as *butter birds* in Jamaica. In the spring the male acquires his black and buff suit without molting any feathers, whence the correct popular notion, based however on erroneous premises, that the reed birds turn into bobolinks in the spring. The bird is abundant in most of the United States, and is a regular migrant, breeding on the ground in meadows in the Northern States and Canada. In the fall when fat and flocking in the marshes to feed upon wild oats (*Zizania*), it is much esteemed for the table. Also called *bob lincoln*, facetiously *Robert of Lincoln* (see *bob lincoln*), *skunk blackbird*, from its coloring which resembles that of the skunk, and *meadowink*.

(b) Heated, inflamed, bursting with passion as, *boiling* indignation.—**Boiling spring**, a spring or fountain which gives out water at the boiling point or at a high temperature. The

most remarkable boiling springs are the *geysers*, which throw up columns of water and steam, but there are many others in various parts of the world, often associated with *geysers*, characterized only by ebullition and emission of steam. Some of the latter, as in California and New Zealand, are strongly impregnated with mineral matters and variously colored, while others are charged with liquid mud. See *geyser*.

boilingly (boi'ling-li), *adv* In a boiling manner.

Rise *boilingly* higher. *Byron*, *Manfred*, i 1

boiling-point (boi'ling-point), *n* The temperature at which a liquid is converted into vapor with ebullition, more strictly, the temperature at which the tension of the vapor is equal to the pressure of the atmosphere. This point varies for different liquids, and for the same liquid at different pressures, being higher when the pressure is increased, and lower when it is diminished. Under the normal atmospheric pressure (see *atmosphere*) water boils at 212° F (100° C, 392° R), and it is found that the boiling point varies 88 of a degree F for a variation in the barometer of half an inch. Hence water will boil at a lower temperature at the top of a mountain than at the bottom, owing to diminution in the pressure, a fact which leads to a method of measuring the height of a mountain by observing the temperature at which water boils at the bottom of the mountain and at the top. At the top of Mont Blanc water boils at 185° F. Under a pressure of about $\frac{1}{10}$ of an atmosphere water would boil at 40° F, while under a pressure of 10 atmospheres the boiling point would be raised to 356° F. A liquid may be heated much above its true boiling point without boiling, but the superheated vapor immediately expands until its temperature is reduced to the boiling point. Hence, in determinations of the boiling point, the thermometer is never immersed in the liquid, but in the vapor just above it.—**Kopp's law of boiling-points**, the proposition that in certain homologous series of chemical substances each addition of CH₂ is accompanied by a rise in the boiling-point of about 19.5° C.

bolometer (bō-lom'e-tēr), *n.* [*< Gr* *βολή*, a throw, a glance, a ray (*< βαλλειν*, throw), + *μετρον*, a measure] An instrument devised by Professor S P Langley of the United States for measuring very small amounts of radiant heat. Its action is based upon the variation of electrical resistance produced by changes of temperature in a metallic conductor, as a minute strip of platinum. This strip forms one arm of an electric balance, and the change in the strength of the electric current passing through it because of this change of resistance is registered by a delicate galvanometer. It indicates accurately changes of temperature of much less than 0.001° F. It has been used in the study of the distribution of heat energy in the solar, lunar, and other spectra. Dryden, Criticism in Tragedy

=Syn 3 *Bombast*, *Fustian*, *Bathos*, *Turgidness*, *Tumultuous*, *Rant*. "*Bombast* was originally applied to a stuff of soft, loose texture, used to swell the garment. *Fustian* was also a kind of cloth of stiff, expansive character. These terms are applied to a high, swelling style of writing, full of extravagant sentiments and expressions. *Bathos* is a word which has the same application, meaning generally the mock heroic—that 'depth' into which one falls who overleaps the sublime the step which one makes in passing from the sublime to the ridiculous. (*De Mille, Elements of Rhetoric*, p 225) *Bombast* is rather stronger than *fustian*. *Turgidness* and *tumidness* are words drawn from the swelling of the body, and express more inflation of style without reference to sentiment. *Rant* is extravagant or violent language, proceeding from enthusiasm or fanaticism generally in support of extreme opinions or against those holding opinions of a milder or different sort. The first victory of good taste is over the *bombast* and conceits which deform such times as these.

The caterpillar of the *Bombyx mori* is well known by the name of *silk worm*. When full grown it is 3 inches long, whitish gray, smooth, with a horn on the penultimate segment of the body. It feeds on the leaves of the mulberry (in the United States also on those of the Osage orange), and spins an oval cocoon of the size of a pigeon's egg, of a close tissue, with very fine silk, usually of a yellow color, but sometimes white. Each silk fiber is double, and is spun from a viscid substance contained in two tubular organs ending in a spinneret at the mouth. A single fiber is often 1,100 feet long. It requires 1,600 worms to produce 1 pound of silk. Greek missionaries first brought the eggs of the silkworm from China to Constantinople in the reign of Justinian (A. D. 527-565). In the twelfth century the cultivation of silk was introduced into the kingdom of Naples from the Moors, and several centuries afterward into France. The silkworm undergoes a variety of changes during the short period of its life. When hatched it appears as a black worm, after it has finished its cocoon it becomes a chrysalis, and finally a perfect cream colored insect or moth, with four wings. For other silk spinning *bombycids*, see *silkworm*. See cut in next column.

consisting of branching cells lying in an intercellular substance made hard with earthy salts (consisting of calcium phosphate with small amounts of calcium carbonate and magnesium phosphate, etc.), and forming the substance of the skeleton or hard framework of the body of most vertebrate animals. When the earthy salts are removed, the remaining intercellular substance is of cartilaginous consistency, and is called ossein or bone cartilage.

Through the substance of *bone* are scattered minute cavities—the lacunae, which send out multitudinous ramifications, the canaliculi. The canaliculi of different lacunae unite together, and thus establish a communication between the different lacunae. If the earthy matter be extracted by dilute acids, a nucleus may be found in each lacuna, and, not unfrequently, the intermediate substance appears minutely fibrillated. In a dry bone, the lacunae are usually filled with air. When a thin section of such a bone is covered with water and a thin glass, and placed under the microscope, the air in the lacunae refracts the light which passes through them in such a manner as to prevent its reaching the eye, and they appear black. All bones, except the smallest, are traversed by small canals, converted by side branches into a net work, and containing vessels supported by more or less connective tissue and fatty matter. These are called *Haversian canals*. *Huasey and Youmans*, *Physiol*, § 350.

2. One of the parts which make up the skeleton or framework of vertebrate animals as, a *bone* of the leg or head. Bones of cattle and other animals are extensively used in the arts in forming knife handles, buttons, combs, etc., in making size, gelatin, lampblack, and animal charcoal, and for various other purposes. They are also extensively employed as a ma-

nure for dry soils, with the very best effect, being ground to dust, bruised, or broken into small fragments in mills, or dissolved in sulphuric acid. The great utility of bones as a manure arises from the phosphate of lime they supply to the soil.

Shak., J. C., v. 5

bookkeeper (bûk'kê'pér), *n*. One who keeps accounts; one whose occupation is to make a formal balanced record of pecuniary transactions in account-books.

bookkeeping (bûk'kê'ping), *n*. The art of recording pecuniary transactions in a regular and systematic manner, the art of keeping accounts in such a manner as to give a permanent record of business transactions from which the true state or history of one's pecuniary affairs or mercantile dealings may at any time be ascertained. Properly kept books show what a merchant has, what he owes, and what is owing to him, as well as what sums he has received and paid, the losses he has incurred, etc. Books are kept according to one of two chief methods, viz, by *single* or by *double entry*. The former is more simple and less perfect than the latter, and is now in use chiefly in retail business. In *bookkeeping by single entry*, three books, a day book, a cash book, and a ledger, are commonly used, but the essential book is the ledger, containing accounts under the names of the persons with whom a trader deals, goods or money received from any one of them being entered on one side of the account, called the credit side, and goods sold or money paid to that person being entered on the opposite or debit side of the account. In *bookkeeping by double entry* the ledger accounts are of two kinds, personal accounts such as those just described, and book accounts, in which the commodities dealt in are made the subjects of separate accounts, and have a debit and a credit side, as in personal accounts. Thus, if a trader purchases 100 bales of cotton from A. B. the account in the ledger headed A. B. is credited with 100 bales of cotton, so much, while the account headed Cotton is debited with the same quantity and amount, should the trader sell 10 bales to C. D., the account headed C. D. is debited with 10 bales at so much, and the account headed Cotton is credited with 10 bales, and so on. These book accounts are based on the principle that all money and articles received become debtors to him from whom or to that for which they are received, and, on the other hand, all those who receive money or goods from us become debtors to cash or to the goods. In this way every transaction is entered in the ledger on the creditor side of one account and on the debtor side of another. The books used in double entry vary in number and arrangement according to the nature of the business and the manner of recording the facts. Transactions as they take place from day to day are generally recorded in such books as the stock book, cash book, bill book, invoice book, and sales book, or they may all be recorded in order in a waste book or day book. Upon these books or additional documents are based the journal and ledger. The former contains a periodical abstract of all the transactions recorded in the subordinate books or in documents not entered in these, classified into debits and credits, while the latter contains an abstract of all the entries made in the former, classified under the heads of their respective accounts.

3 One who makes a book (see *book*, *n*, 3) on a race or other doubtful event, a professional betting man. See *extract*.

In betting there are two parties—one called "layers," as the book makers are termed, and the others "backers," in which class may be included owners of horses as well as the public. The backer takes the odds which the book maker lays against a horse, the former speculating upon the success of the animal, the latter upon its defeat, and taking the case of (remember the Derby of 1872, just before the fact, the book maker) would have laid 8 to 1, or perhaps 1000 to 1, against him, by which transaction, if the horse won, as he did, the backer would win 1000 for risking 100, and the book maker lose the 1000 which he asked to win the smaller sum. At first sight this may appear an act of very questionable policy on the part of the book maker, but really it is not so, because so far from running a greater risk than the backer he runs less, inasmuch as it is his plan to lay the same amount (1000) against every horse in the race, and as there can be but one winner, he would in all probability receive more than enough money from the many losers to pay the stated sum of 1000 which the chances are he has laid against the one winner, whichever it is.

[The earliest instance of the word in this sense appears to be in the following passage.

"The Republicans of every other State are of the same way of thinking. The fact is, the Grant movement (for a third term of the presidency) is booming." *J. B. McCullagh*, in St. Louis Globe Democrat, July 13, 1878.

Mr. McCullagh, in a letter to one of the editors of this Dictionary, says "I cannot explain how I came to use it, except that, while on the gunboats on the Mississippi river during the war, I used to hear the pilots say of the river, when rising rapidly and overflowing its banks, that it (the river) was 'booming.' The idea I wished to convey was that the Grant movement was rising — swelling, etc. The word seemed to be a good one to the ear, and I kept it up. It was generally adopted about a year afterward. I used it as a noun after a while, and spoke of 'the Grant boom.'"

They all say that one railroad spoils a town, two bring it to par again, and three make it boom. *E. Marston*, Frank's Ranch, p. 26.

boomerang (bôm'ne-rang), *n.* [Recently also *boomerang*, *boomerang*, *boomerang*, from a native name in New South Wales, *wo-mur-rang* and *bumarin* are cited as aboriginal names of clubs.] 1 A missile weapon of war and the chase, used by the aborigines of

Australia, consisting of a rather flat piece of hard wood bent or curved in its own plane, and from 16 inches to 2 feet long. Generally, but not always, it is flatter on one side than on the other. In some cases the curve from end to end is nearly an arc of a circle, in others it is rather an obtuse angle than a curve, and in a few examples there is a slight reverse curve toward each end. In the hands of a skilful thrower the boomerang can be projected to great distances, and can be made to ricochet almost at will, it can be thrown in a curved path, somewhat as a bowl can be "screwed" or "twisted," and it can be made to return to the thrower, and strike the ground behind him. When the rise of the tide begins, the surface of the water is disturbed in mid channel, but the water is not broken, it is merely like a common wave But as this rapid rise elevates the surface suddenly above the level of the flat sands, the water immediately rushes over them with great velocity, and with a broken front, making a great noise And this is the whole of the bore

Bostrychidae live in companies, and belong to the most dreaded destroyers of forests of conifers. The way in which they eat into the bark is very peculiar, being characteristic of the individual species and indicative of their mode of life. The two sexes meet in the superficial passages, which the female, after copulation, continues and lengthens in order to lay her eggs in pits which she hollows out for that purpose. The larvae, when hatched, eat out lateral passages, which, as the larvae increase in size and get farther from the main passage, become larger, and give rise to the characteristic markings on the inside of the bark

botany (bot'a-nī), *n* [Early mod E also *botane*, formed from *botan*, as if *< Gr βοτάνη*, a rare var of *βοτάνη*, an herb, grass, fodder, *< βοσκήν*, feed, mid *βοσκήναι*, feed one's self, cf *L vesci*, eat] The science of plants. It treats of the forms of plants, their structure, the nature of the tissues of which they are composed, the vital phenomena connected with them, the arrangement of them into larger and smaller groups according to their affinities, and the classification of these groups so as to exhibit their mutual relations and their position in the vegetable kingdom as a whole. The science further investigates the nature of the vegetation which at former epochs lived on the earth, as well as the distribution of plants at the present time. It is thus divided into several sections: (a) *Structural or morphological botany*, that branch of the science of botany which relates to the structure and organization of plants, internal or external, independently of the presence of a vital principle. Also called *anatomy*. (b) *Physiological or biological botany*, that branch which relates to the history of vegetable life, the functions of the various organs of plants, and their minute structure and method of growth. (c) *Descriptive botany*, that branch which relates to the description and nomenclature of plants. Also called *phenology*. (d) *Systematic botany*, that branch which relates to the principles upon which plants are to be classified or arranged with reference to their degrees of relationship. The system of classification now universally adopted is that proposed by Antoine Laurent de Jussieu, and improved and enlarged by DeCandolle, Brown, and others. It is generally called the *natural system* because it is intended to express, as far as possible, the various degrees of relationship among plants as these exist in nature, and to group next to each other the various species, genera, and orders which are most alike in all respects. Several artificial systems have been proposed, as that of Linnæus, based on the modifications of the corolla, but the best known is that of Linnæus founded on the stamens and pistils. This system, which was designed by Linnæus to be only temporary, proved of great value to the science of botany, but it has now gone entirely out of use, or is used only as a partial index to the vegetable kingdom. (e) *Geographical botany*, that branch which relates to the natural distribution of plants over the globe, and to the inquiry into the causes which have influenced or maintain this distribution. (f) *Paleontological or fossil botany*, that branch which embraces the study of the forms and structures of the plants found in a fossil state in the various strata of which the earth is composed.

boundary (bound'ā-rī), *n*, pl *boundaries* (-rīz) [*< bound¹* + -ary, cf *ML*, *bunnarium*, *bounarium*, a field with certain limits] That which serves to indicate the bounds or limits of anything, hence, a limiting or bounding line, a bound as, the horizon is the *boundary* of vision, the northern *boundary* of the United States

J R Green, *Conq of Eng*, p 212

=**Syn.** *Boundary* *Bound*, *Bord*, *Confine*, *Frontier*—A *boundary*, in its strict sense, is a visible mark indicating a dividing line between two things, or it is that line itself, it marks off a given thing from other things like in kind, as one field or country from another. A *bound*, on the other hand, is the limit or furthest point of extension of one given thing, that which limits it not being specially considered, it can be used of that which is not limited by anything like in kind as, the *boundaries* of a field, but the *bounds* of space, the *boundaries* of a science, but the *bounds* of knowledge. Hence the figurative uses of *bound* as, "I believe I speak within *bounds*," where *boundaries* would be absurd. Thus, the *bounds* of a parish may be defined by certain marks or *boundaries*, as heaps of stones, dikes, hedges, streams, etc., separating it from the adjoining parishes. But the two words are often interchangeable. A *border* is a belt or band of territory lying along a *bound* or *boundary*. A *confine* is the region at or near the edge and generally a narrower margin than a *border*. A *frontier* is a border view (d as a front or place of entrance as, he was met at the *frontier*). The word is used most in connection with military operations as, their *frontiers* were well protected by fortresses

Bovidae (bō'vi-dē), *n pl* [NL, < *Bos* (Bov-), ox, + *-idæ*] A family of hollow-horned ruminants, the ox tribe, containing the bovines. The family was formerly nearly coextensive with the genus *Bos* in a large sense, including cattle as distinguished from goats, sheep, and antelopes. In this acceptance the family corresponds to the modern subfamily *Bovina*. It has been found impossible, however, to draw any sharp dividing line between cattle and other hollow-horned ruminants, among some of which, as the antelopes, connecting links occur. Therefore, notwithstanding the familiar difference between an ox and a sheep, for example, or a goat and an antelope, the family *Bovidae* now contains all of these which have hollow, persistent horns, common to both sexes, generally two, sometimes four, and certain common cranial characters by which they collectively differ from the *saiga* on the one hand and from the pronghorn on the other, these two so called antelopes being made respectively the types of the families *Sagidae* and *Antilocapridæ*. The *Bovidae* as thus defined are conventionally divided into five subfamilies: *Bovina*, cattle, *Omobovina*, muskoxen, *Omosa*, sheep, *Caprina*, goats, and *Antilopina*, antelopes. See these words

The head is carried low upon a short neck, the legs are relatively short, with the canon bones little or no longer than the phalanges, the hoofs broad, the muffle naked, the horns simple and unbranched, and the tail tufted at the end. There are four inguinal teats. The leading genera are *Bos*, *Bubalus*, *Anoa*, *Buon*, and *Poephagus*, or oxen, buffaloes, bisons, and yaks

2 A weapon consisting of a strong strip of elastic wood or other elastic material, with a string stretched between its ends, used for shooting arrows. When the bow has been bent to its full extent by pulling the string back from it the recoil of the string (against the inner side of which the notch of the arrow is placed) when released impels the arrow. The bow and arrow have been used in all ages and by many peoples as a weapon, and, though superseded in the advance of civilization by firearms are still in use among savage tribes, and are officially recognized weapon of the Manchu garrisons of China, where archery is still one of the subjects of examination for officers in the regular army. Bows were at one time divided into *longbows* and *crossbows*. During the middle ages the nations of Europe used longbows of 5 or 6 feet in length, the shorter ones being used by horsemen, and the longer by the foot archers. The bows now commonly used in archery are of two kinds, the single piece bow, or self bow, and the back or union bow. The single piece bow is made of one rod of hickory, lance wood, or yew, the last, if perfectly free from knots, being considered the most suitable wood. The union bow is made of two or sometimes three pieces glued together. See cuts under *archer*, *bowman*, and *crossbow*

These, being rubbed with resin and drawn over the strings of the instrument, cause it to sound. Brahmo-Somaj (brä'mō-sō-māj'), *n* [*< Hind. brāhma, Brahma* (prayer), + *samāj*, society, assembly, lit. a worshipping assembly. See *Brahma*], *Brahman* 1. A monotheistic religion in India, which originated with Rājā Ram Mohun Roy, a Hindu reformer, who died in 1833, and received a new impulse and a new direction under his successor, Keshub Chunder Sen, who died in 1885. The mystical theology of the Brahmo-Somaj can only be proximately stated in the language of the identical philosophy. Its fundamental tenet is the universal presence of the Divine Spirit who pervades all nature and inspires all who are willing to receive him. Man is equipped for this purpose with a faculty of spiritual insight, a faith faculty, called *bona*. Inspiration is a universal fact, and all the great world religions have been divinely inspired prophets, all the great world religions contain some divine truth, and in all the great religions there is some spiritual benefit. It is not a religion which Christ is regarded as simply the greatest of these inspired prophets, or as something more. Some utterances indicate a recognition of his character as divine. The Brahmo-Somaj differs from Buddhism in teaching the personal communion of the soul with a personal God and from Christianity in not teaching any specific revelation of a remedy for sin. It is an aggressively missionary religion and its preaching has been accompanied by works of practical reformation such as the abolition among its adherents of polygamy of caste and of idolatry in all its forms, the reformation of marriage customs and a temperance reform.

Cb, cerebellum, or little brain — the striated surface of its right half, MOB, medulla oblongata, N, the spinal cord with beginnings of the spinal nerves, S, body of sixth cervical vertebra, Sp, its neural spine, or spinous process.

In *anat.*, the soft grayish and whitish mass filling the cranial cavity of a vertebrate, consisting of ganglionic nerve-cells and nerve-fibers, with the requisite sustentacular and vascular

tissue; the encephalon (which see); the part of the cerebrospinal axis which is contained in the cranium. It is divided by anatomists into—(1) the *prosencephalon*, comprising the cerebral hemispheres

Base of Human Brain

A, frontal lobe of cerebrum, B temporal lobe of same separated from A by the Sylvian fissure, C, corpus callosum—its free end, D, cerebellum, E, medulla oblongata, F, pituitary body, G, olfactory nerve (so called—rather olfactory lobe or rhinen cephalon), H, optic nerve after decussation with its fellow at the chiasm, I, motor oculi nerve, J, pathetic nerve, K, trigeminal trifacial nerve, L, abducent nerve, M, facial nerve, N, auditory nerve, O, glossopharyngeal nerve, P, pneumogastric nerve, Q, spinal accessory nerve, R, hypoglossal nerve. The rounded masses near S are the corpora albicantia, T rests upon the pons Varolii

ley and others the encephalon of the above nomenclature is called *metencephalon*, and the next segment (the fifth) is then named *myelencephalon*. Common English equivalents of the above five segments are *forebrain*, *twain brain*, *midbrain*, *hindbrain*, and *afterbrain*, these are terms translated directly from the nomenclature of the German anatomists, who call them respectively *vorderhorn*, *zwischenhorn*, *mittelhorn*, *hinterhorn*, and *nachhorn*. Haeckel calls them *protopsyche*, *deutopsyche*, *metopsyche*, *metapsyche*, and *epipsyche*. These five segments are fundamentally distinct, and correspond embryologically to as many cerebral vesicles or brain bladders which arise from three primitive vesicles by subdivision. The simplest and a common division of the brain is into the *cerebrum* or *brain proper*, the *cerebellum* or *little brain*, the *pons Varolii*, and the *medulla oblongata*. (See cuts under *cerebral* and *corpus*.) The human brain is distinguished for the relatively enormous size and surface complexity of the cerebrum or prosencephalon, which completely covers the cerebellum and olfactory lobes, and is marked by many deep fissures or sulci separating gyri or convolutions. The cerebrum is divided into right and left halves, or cerebral hemispheres, connected by the great transverse commissure or corpus callosum. Each hemisphere is divided into three primary lobes, frontal, parietal, and occipital, and many more detailed subdivisions of its surface are recognized. The interior of the brain (which is primitively hollow) is traversed in the adult by a set of system of connected cavities known as *ventricles* or *cavities*. The first and second of these are the right and left ventricles of the hemispheres, or *proventricles*, the third is the *diacoele*, the fourth is the *epicoele*, passages connecting these are the foramina of Monro and the aqueduct of Sylvius. The brain and adjoining portions of the spinal cord give rise to 12 pairs of nerves, called *cranial nerves* because they emerge from foramina in the base of the skull (See *cranial*). Brain substance is of two kinds, gray ganglionic or cellular nerve-tissue, and white commissural or fibrous nerve tissue. The gray matter which invests the cerebrum and cerebellum is also called the *cortical substance*, in distinction from the white or *medullary substance* of the interior. A brain is in fact a collection of gray ganglia united by white commissures. Besides the cortex, there are several ganglia or collections of gray matter in the interior, as the corpora striata, the optic thalami, the optic lobes or corpora quadrigemina, the corpora dentata of the cerebellum, and the corpora olivaria of the medulla oblongata. Connected with the brain are two non nervous structures, the conarium or epiphysis cerebri and the pituitary body or hypophysis cerebri. The brain is covered by three membranes or *meninges*, of which the external is the dura mater, the middle the arachnoid, and the inner the pia mater. Most mammals have a brain like that of man, but in descending the mammalian scale the cerebrum becomes relatively smaller and has fewer if any convolutions, the corpus callosum becomes rudimentary, and the olfactory lobes enlarge. (See cuts under *gyrus* and *sulcus*.) In the brain of birds the hemispheres are smooth, there is no corpus callosum or pons Varolii, and the optic lobes are of immense size. There is no brain in the lowest vertebrate, *Amphioxus*. The average weight of the brain in adult males of the European type is about 1,400 grams (49.5 ounces), in women about 1,250 grams (44 ounces). The brain is in its highest activity the organ of consciousness or mind, and its general function is that of furnishing the most complex and extensive outgoing stimulation of muscles and other active tissues as a response, more or less immediate, to the most complex and extensive incoming sensory stimulation. With functions of this high degree of complexity are associated in some parts much simpler functions resembling those of the spinal cord. The cortex of the cerebral hemispheres is the portion of the brain in which the most complex coordinations seem to be effected, and which is most directly involved in mental acts. Certain parts of the cortex are, however, peculiarly related to certain special incoming or outgoing stimulations, and are called sensory or motor centers. (See *cerebral*, and *cerebral localization*, under *localization*.) The corpus striatum is usually regarded as especially concerned with stimulations passing downward, and the optic thalamus with those passing upward, among

the latter, those of sight are connected with the hinder part of the thalamus. The nates are involved in the sight function, and the testes seem to have close relations with the stimuli entering by the auditory nerve. The cerebellum is concerned with the coordination of muscular contractions in the carrying out of voluntary actions, while the medulla oblongata contains a large number of centers for comparatively simple functions, as vasomotor action, cardiac action, respiration, deglutition, etc. (See also cut under *encephalon*.) From its complexity, the brain is usually spoken of in the plural in certain relations as, to beat out or to rack one's brains.

2. In entom., the principal ganglion of the nervous system, situated in the head, over the esophagus, and formed by the coalescence of several supra-esophageal ganglia. The nerves of the eyes and antennae are directly connected with it, and it gives off two inferior branches which surround the esophagus and unite beneath in the subesophageal ganglion. Sometimes this ganglion is regarded as a part of the brain, being distinguished as the *cerebrum*, while the principal or upper ganglion is called the *cerebrum*.

3. The same or a corresponding portion of the nervous system in many other invertebrates.

4. Understanding, intellectual power, fancy, imagination commonly in the plural as, a man of brains, "my brain is too dull," Scott

the medium of water. They are highly vascular, with thin walls, permitting the aeration of the blood by the oxygen in the water which comes in immediate contact with them. They are developed from different parts of the body in different classes of animals. See *gill*, and cuts under *Polyplocophora* and *Tetrabranchiata*.

2 In *Arthropoda*, as crustaceans, specifically, the externally projecting processes of the body or its limbs, which are supplied with venous blood (which is thus brought into contact with the air dissolved in water), and constitute a special respiratory organ. See cut under *Podophthalmina*. Other kinds of respiratory organs in arthropods are *trachea branchiae*, *trachea*, and *pulmonary sacs*. See these words.

3 In *Vermes*, any appendages of the head or body so modified as to act as a respiratory organ, the various processes which protrude or radiate from the head or other region of the body, and have, or are supposed to have, a respiratory function. See cut under *Protula*.

In [*Amphionomada*, *Paracida*, and *Perbellida*] the branchiae are ciliated branched plumes or tufts attached to the dorsal surface of most or few of the somites. In [*Serpulidae*] they are exclusively attached to the anterior segment of the body and present the form of two large plumes, each consisting of a principal stem, with many lateral branches. Huxley, *Anat. Invert.*, p. 210.

4 In *entom.* gill-like appendages on the bodies of certain insect-larvae and pupae which live in the water, as many dragon-flies and gnats. They are expansions of the integument, and it is supposed that they absorb air from the water, and convey it by the minute ramifications of the tracheal vessels, with which they are abundantly supplied, into the main tracheae, to be distributed over the whole body. Newport.

branchial (brang'ki-ál), *a*. [*< NL branchialis, < L branchia, gills, see branchiae.*] 1 Of or pertaining to the branchiae or gills, or, in animals which have no gills properly so called, of or pertaining to the parts considered homologous with gills, as, in a bird or mammal, parts of the third postoral visceral arch, or of any visceral arch behind the hyoidan. — 2 Performed by means of branchiae as, *branchial respiration*, a *branchial function*. — **Branchial aperture**, the aperture or outlet for water which has supplied the branchiae, lying behind them. In fishes there are 2, one on each side, rarely the two are confluent in a single inferior aperture. In schizothoracids they are generally in 5 pairs, rarely in 6 or 7. In myxozoids they are usually in 7 pairs, rarely 6 or more than 7, and sometimes confluent in an inferior pair of "pores." In *Invertebrata* they vary. — **Branchial arch**, in fishes, one of the arches of the branchial apparatus which support the branchial filaments on each side. — **Branchial bar**, the hardened portion of the branchial apparatus which supports the gills, same as *branchial arch*. — **Branchial basket**. See *basket*, 10. — **Branchial cavity**, or *branchial chamber* (a) The cavity on each side of which are the branchiae. It is behind and generally confluent with the oral cavity. (b) In *Crustacea* a cavity or space inclosed by the branchios tegite or gill cover (formed by a free pleural part of the carapace), and bounded internally by the epimeron of the branchiostegous somites. — **Branchial cleft**, one of the lateral foramina behind the head which are apparent in the embryos of vertebrates, soon disappearing in the higher types, but longer persistent (sometimes through life) in the lower, as in the amphibia, homologous with the *branchial apertures*. — **Branchial coil**, a spirally curved tube formed by a diverticulum of the superior pharyngeal mucous membrane in certain fishes, such as the elopids (for example, *melanoides*) and related forms. — **Branchial duct**, in myxozoids, a short canal (interior) between a branchial pouch and the intestinal cavity, or one (exterior) between a pouch and the exterior of the body. — **Branchial fold**, the series of branchial filaments around the convex margin of a branchial arch. — **Branchial framework**. Same as *branchial skeleton*. — **Branchial ganglion**, a ganglion which supplies the branchiae, as in certain mollusks. — **Branchial gut**, a rudimentary branchial chamber. — **Branchial heart**, a specialized widened vascular canal which supplies the branchiae. — **Branchial lamella**, a row of branchial filaments approximated to one another and forming a lamella like structure. In fishes there are generally two lamellae to most of the arches, surmounting their convex edges. Also called *branchial plate*. — **Branchial pharynx**, a pharynx with a branchial apparatus, as in the tunicates. — **Branchial plate**. Same as *branchial lamella*. — **Branchial pore**, a pore like branchial aperture common to all the branchial ducts of one side, such as occurs in myxozoids or bags. — **Branchial pouch**, in myxozoids and schizothoracids, a pouch like structure of the branchial apparatus in which and from which the branchiae are developed. — **Branchial ray**, in schizothoracids, one of the cartilaginous rods radiating from a branchial arch backward, and affording support to the branchial pouches. — **Branchial respiration**, respiration by means of branchiae or gills. — **Branchial sac**, the respiratory chamber containing the branchiae in the tunicates. It is the large pharyngeal dilatation into which the oral aperture leads, and which presents the stigmata through which the cavity of the sac communicates with the atium. See cut under *Tunicata*. — **Branchial septum**, in certain tunicates (for example, *Salpidae*), a gill detached from the wall of the branchial chamber and forming a lateral stretching from its dorsal wall to the ventral wall. — **Branchial sinus**, a vascular sinus into which blood passes from the visceral sac on its way to the branchiae. — **Branchial skeleton**, the harder framework which is subjoined to the branchiae in branchiostegous animals. Also called *branchial framework*. — **Branchial slit**, the space between neighboring branchiae or branchial arches. — **Branchial tentacle**, in certain worms (for example, *Polychaeta*), one of the tentacle like organs of the head, performing in part

a respiratory function. — **Branchial tuft**, in tubicolous chetopodous worms, an aggregation of contractile tentacular filaments in the cephalic region, assuming in part the office of branchiae.

Branchiata (brang-ki-á'tá), *n pl* [*NL, neut pl of branchiatus, having gills, see branchiate*] In *zool.*, a name used with various significations (a) In some systems of classification, one of the prime divisions of the *Arthropoda*, by which all crustaceans, in a broad sense, are collectively distinguished from the *Tracheata*, or insects in the widest sense (arachnids, myriapods, and insects proper) so called from having a branchial instead of a tracheal respiratory apparatus. In Gegenbaur's system a third prime division, *Protobranchiata*, established for *Pteropoda* alone, intervenes between *Branchiata* and *Tracheata*. The *Branchiata* are primarily divided into *Crustacea* proper (including the two main groups of *Entomostraca* and *Malacostraca*) and *Pteropoda*, represented by *Lamulus*, etc. (b) A division of vertebrates containing those which for some time or permanently breathe by gills, the amphibians and fishes, as distinguished from reptiles, birds, and mammals, synonymous with *Ichthyopoda* (which see). (c) In mollusks, same as *Branchiostegopoda*. (d) A division of annelids containing those which breathe by gills, or the tubicolous and errant worms, corresponding to the groups *Cephalobranchia* and *Notobranchiata*. (e) A group of echinoderms with gills on the buccal membrane and with ambulacral plates only on the latter, including all the echinoid families except *Cidaridae*. Ludwig.

Respiration may be effected in three ways first, the blood may be simply exposed to the water in the thin walls of the mantle cavity, as in some of the *Heteropoda*, secondly, the respiratory organs may be in the form of outward processes of the integument, exposed in tufts on the back and sides of the animal, as in the *Audobranchiata*, such as the sea slugs, etc., and thirdly, the respiratory organs may be in the form of pectinated or plume like branchiae, contained in a more or less complete branchial chamber formed by an inflection of the mantle as in the *whelks*, etc. The *Branchiostegopoda* fall into two distinct series, the one being hermaphrodite, with the gills placed toward the rear of the body, and the other having the sexual organs in distinct individuals. The *Branchiostegopoda* are divided into three orders (1) *Promobranchiata* (sexes distinct, gills usually inclosed), as *whelks*, etc., (2) *Gynobranchiata* (sexes usually united in the same individual, gills often exposed), as sea slugs, etc., (3) *Heteropoda* (free swimming gastropods), as members of the genus *Carnaria*.

An important alloy, consisting essentially of copper and zinc. The proportion in which the two metals are combined differs considerably in different kinds of brass. Brass in general is harder than copper, and consequently wears better than that metal. It is malleable and ductile, so that it can be easily rolled into thin sheets, or be hammered into any desired shape. It turns easily in the lathe, and can be drawn into fine wire, moreover, it has an attractive golden color, and is cheaper than copper. The color of brass varies with the proportions of the ingredients. A full yellow variety contains about two parts of copper to one of zinc. This alloy was known to the ancients, and was made by them before they had any knowledge of the metal zinc as such. It is not among the metallic substances mentioned by Homer, but it was well known to Strabo, who describes the mode of manufacturing it from the zinciferous ore (calamin), and calls the alloy *archale* (ἀρχαλός). See *archale*, *pinchbeck*, *prince's metal*, *monac gold*, *Muntz's metal*, and *yellow metal*. In rhetorical comparisons, brass is a common type of hardness, durability, or obduracy

Slabs of stone inlaid with figures, etc., in brass are also called *brasses*, and are a usual form of medieval monument. Both the plates of brass and the inlaid stones were frequently placed in the ordinary pavement of churches. Comparatively few of such monuments executed wholly in brass survive, as the value of the metal has caused it to be melted down and applied to other uses

= *Syn.* 1 *Gallant*, *Valiant*, *Courageous*, *Brave*, *Heroic*, valorous, dauntless, chivalrous, doughty, resolute, manly. *Gallant*, splendid in dress or qualities, is most appropriately used with regard to courage which exhibits itself in deeds attracting attention and applause, of the first four words it is that which may have in it most of compliment and least of high commendation, but it is often a strong word, expressing splendid bravery in action as, he was a *gallant* officer. *Valiant* is also brave in action, especially in opposing physical force, as in battle. The word is now elevated and poetic. *Courageous* denotes the possession of that spirit which enables one fearlessly and with full presence of mind to face danger. *Brave* is the most comprehensive of the words. It may denote the possession of the highest and noblest kind of courage and fortitude, of that spirit which enables a man to bear up against evil and danger, as well as to go forth to face it. *Courageous* has much of this breadth of meaning, but is applicable rather to doing than to enduring, *brave* is both passive and active. *Heroic* combines the meaning of all the other words in the superlative degree. It indicates a lofty superiority to fear, a noble self forgetfulness, an almost superhuman power to dare, achieve, or suffer. It bears the same relation to the other words that *sublime* bears to *great*, *grand*, or *lofty*.

for comparatively small spans, and for unimportant work when stone cannot readily be obtained In more important works it is often combined with stone which is introduced to bind to distribute pressure, to protect the more exposed portions and for architectural effect Stone, wherever it can be used, is the most valuable material, on account of its massiveness, stability of form, and resistance to the elements, but it is inferior to iron in economy of construction, and ready adaptability to various situations Among the finest monuments of antiquity are ranked the remains of Roman arch stone bridges The largest stone

arch known is that of the bridge of the Washington aqueduct over the Cabin John Creek (span 220 feet, rise 57 25 feet), the next is that over the river Dee at Chester (span 200 feet, rise 42 feet). The first arched bridge built of iron was erected over the river Severn, in England, and consists of 5 parallel ribs of cast iron, with a span of 100 and a rise of 40 feet. The Southwark bridge over the Thames at London, the central one of the three arches of which has a span of 240 with a rise of 24 feet, formerly ranked as the largest iron arched bridge, but this span has since been more than doubled, as notably in the bridge over the Mississippi at St. Louis, and the Washington bridge over the Harlem river in New York city In an *arched beam bridge* arched beams in compression constitute the

principal members and sustain the load The beams are sometimes built of parallel layers of planks, which are made to break joint In the most important constructions the arches are often compound They have been employed in modern bridges of considerable magnitude An *arched truss bridge* is a form in which the compression member is an arched beam, as in the McCallum truss In a *beam-truss bridge* the load is supported by beam trusses or open-work beams A compression chord and a tension chord are essential, and the stresses are transferred from one to the other on the way to the points of support by means of struts and tension bars, which together are called web members See phrases below for other forms

uplift caused by the load when upon the central span and of themselves supporting vertical pressure, or they may form part of other spans similar to the central one This form of bridge presents the great advantage of permitting the construction of the main span without scaffolding beneath A fine example is the cantilever bridge below Niagara Falls, built for the Michigan Central and Canada Southern railways — *Check-bridge of a furnace*, a fire bridge so called because it was supposed to check the draft — *Counterpoise bridge*, a bascule bridge in which counter weights help to raise the platform — *Electric bridge*, a term applied to several contrivances for determining the resistance of an electric circuit, all essentially identical with Wheatstone's bridge (which see, under *resistance*) — *Floating bridge* (a) A boat raft, or pontoon bridge (b) A part of a bridge, supported by a caisson or pontoon, which can swing into and away from the line of roadway (c) *Milit*, a kind of double bridge, of which the upper member projects beyond the lower, and is capable of being moved forward by pulleys used for carrying troops over narrow moats in attacking the outworks of a fort — *Flying bridge*, a suspension bridge, or a bridge built for temporary use, as a pontoon bridge — *Hanging bridge*, a suspension bridge The term is generally applied to the more primitive forms of suspension bridge — *Hoist-bridge* Same as *lifting bridge* — *Induction-bridge* See *induction* — *Lattice-bridge*, a bridge in which the web between the chords or the main compression

II *n* [*< F brilliant*, a diamond] **1** The form in which the diamond and other precious stones are cut when intended to be used as ornaments, whenever the shape and cleavage of the uncut stone allow this to be done without too much loss of material. The brilliant is susceptible of many small modifications as regards the size, proportions and even the number of the facets, but in the most perfect cut there are 58 facets. The general shape of all brilliants is that of two pyramids united at their bases, the upper one being so truncated as to give a large plane

and is formed by removing one third of the thickness of the stone, the opposite small end, called the *culet* or *coilet*, is formed by removing one eighth of the thickness of the stone. The *girdle* is the widest part, and forms the junction line between the upper part, called the *crown*, and the lower part called the *pavilion*. Fig 2 shows the top (a), side (b) and back (c) views of a modern brilliant cut with 58 facets. T is the table, C, the culet, G, the girdle. A, the temples or bezels (of which there are 4 in all), B, the upper quoins or lorengs (of which there are 4), S, star facets (of which there are 8 in the crown), E, skill or half facets (8 in the crown and the same number in the pavilion), D, cross or skew facets (8 in each part), P, pavilion facets (4 in number), Q, lower or under side quoins (of which there are 4) — making 58 facets in all. Sometimes extra facets are cut around the culet, making 66 in all. In fig 3 a and b show top and side views of the single cut, or half brilliant, c is a top view of the old English single cut. In fig 4, a, b, and c show top, side, and back views of a brilliant with 42 facets. In fig 5, a, b, and c show top, side, and back views of the split or double brilliant, with 74 facets. In fig 6, a, b, and c show top, side, and back views of the Portuguese cut, which has two rows of rhomboidal and three rows of triangular facets above and below the girdle. In fig 7, a, gives a side view of the double rose sometimes called the *brillotte* when several more rows of triangular facets are added. Fig 8 shows

the form and size of the famous Regent diamond, belonging to the government of France. It weighs 130 1/2 carats, and is generally considered the most valuable diamond known, having been estimated by experts at twelve million francs. It comes very near being a perfect brilliant in form but is a little too thick or deep for its breadth, while the Koh-i-noor, as cut since it came into the possession of the Queen of England, is too thin or spread. Any gem may be cut in brilliant form but when the word *brilliant* is used by itself, it is always understood to mean a diamond

The refusal of Spain to enter into commercial relations with England made the privileges of the company worthless, but by means of a series of speculative operations and the infatuation of the people its shares were inflated from £100 to £1,060. C., but more probably in the sixth century), regarded by the Buddhists as the fourth in a series of five messianic Buddhas. He was an Indian prince of the Sakya tribe and hence called Sakyammah (the Sakya sage), the name preferred in China and Japan. His original name was Siddhata (literally 'the realization of all the meanings' that is of the portents at his birth) that most used in Burma (Ceylon, etc.) is Gautama or Gotama (literally 'most victorious'), the sacerdotal name of the Sakya tribe.

Buddhism (bo'dizm), *n* [*< Buddha* + *-ism*, = F. *Bouddhisme*] The religious system founded by Buddha, or the Buddha, in India. Its essential principles in so far as they can be reduced to an Oriental form of thought, are that man is under the operation of certain inviolable laws from which there is neither escape nor deliverance, existence under them is an evil, priestly rites and sacrifices are unavailing, death is no escape, but only a transmigration to another form of existence, obedience to the moral laws—the practice of charity, temperance, justice, honesty, truth—insures a sojourn in heaven, followed by a higher existence on the

earth, disobedience insures a punishment in some of the innumerable hot and cold hells (see *naraka*), situated in the interior of the earth or on its furthest verge, followed by a lower state of existence on earth, the supreme felicity to be attained by perfect obedience is the suppression of every passion and desire, and eventually Nirvana, or unconscious existence. If indeed Nirvana be not annihilation. In its original spirit agnostic, if not atheistic, it has become modified in time, and now has its rites and temples, which vary in different nationalities and localities from India. Buddhism spread over Ceylon, Java, Cochinchina, Burma, Tibet, Mongolia, Latav, China and Japan but was stamped out in India by the rise of Hinduism. Also spelled *boudhism*.

Buddhist (bo'dist), *n* and *a* [*< Buddha + -ist*, = *F Boudhist*] *I n* One who professes Buddhism, a follower of the religious system founded by Buddha.

II a Of or pertaining to Buddha or Buddhism. — **Buddhist architecture**, the oldest and most characteristic native style of Indian ecclesiastical architecture, the earliest specimens dating from 250 B.C. and prevailing wherever Buddhism has been established. (b) Stupas or tope, large towers some built in the form of a hemisphere, others partly cylindrical and finished at the top with either a flat disk or a pointed dome like terminal. The tope were erected in honor of some sacred event or place and are sometimes employed to contain relics of Buddha or of a saint. In the latter case the tope is called a *dhupa*. rock and corresponding closely in plan with Christian churches. The positions of the altar or relic casket, altars, and apses are frequently the same in both. (e) Viharas, or monasteries originally built of red sandal wood, but in exceptional circumstances excavated from the solid rock, with halls having their ceilings supported by elaborately sculptured pillars cut from the natural rock and surrounded by a number of small sleeping cells. A characteristic of the Buddhist style is the pseudo arch formed by courses of stones each overlapping that below it, till the two sides approach so closely that the opening at the top can be covered by a single stone.

Many kinds of fruit are propagated in this way, as well as roses and other plants.

—2. The most authoritative official document issued by the pope or in his name usually an open letter containing some decree, order, or decision relating to matters of grace or justice It derives its name from the leaden seal (Latin *bul*) appended to it by a thread or band, which is red or yellow when the bull refers to matters of grace, and uncolored and of hemp when it refers to matters of justice. On one side of the seal is the name of the pope, and on the other are the heads of St Peter and St Paul Bulls are written in Latin, either in the ordinary cursive hand or in round Gothic characters, and have a red seal on the parchment itself, in which the name of the pope encircles the heads of the apostles They begin with the name of the pope followed by the term *episcopus* (bishop) and the words *servus servorum Dei* (servant of the servants of God) and a salutation, and close with the place and date of execution and the subscription of the chancellor or other functionary of the papal chancery The distinctive name of a bull is taken from the first word or words of the general introduction which follows the salutation as, the bull *Unigenitus*, which begins with the words *Unigenitus Dei*, etc., issued in 1713 by Clement XI, (condemning the Janenist propositions set forth in Quenou's "Moral Reflections" A brief, though of equal authority with a bull, differs from it in several important points, chiefly of form It is shorter, relates to subjects of inferior importance, is written in Latin in ordinary Roman letters and on the smooth side of the parchment, uses the word *papa* instead of *episcopus* in the introductory formula, is sealed with red wax instead of lead, and with the pope's private seal, the fisherman's ring, and is never signed by the pope himself, but by a secretary of the papal chancery Both bulls and briefs belong to a class of papal documents generally called *apostolic letters*, these are *encyclical* when addressed to the bishops of the Roman Catholic world, and from their contents are called *constitutions*, *decrees* (ancient), *synodal letters* (also ancient), *rescripts*, *motus proprii*, etc. *Constitutional bulls* are issued after consultation with the consistory of cardinals, and are signed by all the cardinals consulted

Specifically — 2 A small metallic projectile intended to be discharged from a firearm commonly limited to leaden projectiles for small arms

Bullets were formerly always spherical in form, but many changes have been made in them in both shape and structure. The bullet used for rifles of recent construction is elongated and conical, or rather oval at the apex somewhat like half an egg drawn out with a hollow at the base, into which a plug of wood or clay is inserted, and with small cuts (canals) in the metal outside, which are filled with beeswax to lubricate the barrel while the bullet is passing through it. When the gun is fired the plug is driven forward to the head of the cavity, forcing the base of the bullet outward till the lead completely fills the grooves in the rifled barrel. The plug is often omitted, the base of the bullet being forced into the grooves by the expansive force of the powder

The life buoy now in common use in the United States navy consists of two hollow copper vessels, connected by a framework and having between them an up right pole, weighted at the bottom and surmounted by a brass box containing a port fire. This machine is hung over the stern of the vessel, and can be dropped by means of a trigger. At night the burning of the port fire serves to point out its position. See also *cut under breeches-buoy*—*To bleed a buoy* See *bleed*—*To stream a buoy*, to let it drop from the vessel into the water before the anchor is dropped

Burden of proof, in law the obligation resting upon one of the parties to an action to establish an alleged fact by proof, under penalty of having judgment given against him, according to the presumption recognized by the law of evidence in case he adduces no proof. The burden of proof is said to be shifted when the party upon whom it lay has produced sufficient evidence to turn the presumption in his favor. Two circumstances are essential to the existence of a burden of proof: first, there must be a question of fact between two parties before a tribunal which will render a decision whether there is any particular evidence or not, and second, this decision must be governed by rules of presumption, more or less artificially extended so as to lead to a determinate result in every case. In forensic controversy there will or will not be a burden of proof, according as these conditions are or are not fulfilled. In reasonings as contradistinguished from disputations, if they relate to policy, there is nothing to which the term *burden of proof* is applicable. For the decision will be based on considerations of likelihood, economy, safety, etc., but never on formal rules of presumption. A general habit may be followed when decided reasons fail, in questions both of policy and of morals, but the phrase *burden of proof* is not employed in such cases. A speculative or scientific inquiry, on the other hand, cannot be closed until satisfactory evidence has been obtained or curiosity dies out, so that the term *burden of proof* has no meaning in such a connection. Yet an individual reasoner who being impatient of doubt insists on adopting an answer to each question, however blank our ignorance of the facts must often resort to a merely formal presumption, and such persons say that there is a burden of proof upon any possible advocate of the hypothesis which they propose to reject without proof. The term is also used in cases where the absence of observations of a certain kind is itself a significant fact. Thus, we may say that there is a burden of proof upon the evolutionists to explain our not finding forms intermediate between recognized types, that is to say, the non-occurrence of such observations is a fact to be taken into account. — *Syn* Weight, incumbrance, clog, inculus, drag, freight, lading, cargo.

A dry measure, containing 8 gallons or 4 pecks. The imperial bushel legally established in Great Britain in 1824 has a capacity of 2,218 192 cubic inches, and holds 80 pounds avoirdupois of distilled water at the temperature of 62° F. with the barometer at 30 inches. Previous to this the Winchester bushel had been the standard measure from Anglo-Saxon times, its capacity was 2,150 42 cubic inches. The measures of capacity of the United States are founded on the Winchester bushel, the imperial system having been created since the separation of the two countries. The name *Winchester bushel* is derived from the fact that the ancient standard bushel measure of England was preserved in the town hall of Winchester. Numerous bushels were in use in England at the time of the adoption of the imperial system. Thus, by a statute of Anne, a bushel of coal is to contain a Winchester bushel and a quart of water, to be 19½ inches in diameter, and to be heaped in the form of a cone 6 inches high. Various equivalent weights of different commodities had also been made bushels by law. Many of the American States have established equivalent weights, which vary considerably in different States. tion, and not easily separable from the conjunctive use,
under which most of the examples fall. The conjunction,

a prepositional phase, and in other constructions an ad-
verbial phase. See below.]

containing or implying a negation, and intro-
ducing the following clause, in which (the verb
being usually omitted because implied in the
preceding clause) *but* before the noun (subject
or object of the omitted verb) comes to be re-
garded as a preposition governing the noun

quasi preposition) may be a single word, an infinitive or
prepositional phrase, or a clause with *that*

O W. Holmes, What we All Think
By ellipsis of the subject of the clause introduced by *but*
in this construction, *but* becomes equivalent to *that*

Brownings, Last Ride Together

In this construction the negative, being implied in *but*,
came to be omitted, especially in connection with the
verb *be*, in the principal clause, the construction "There
is not *but* one God," as in the first example, becoming
"There is *but* one God," leaving *but* as a quasi adverb,
"only, merely, simply." This use is also extended to con-
structions not originally negative

If God would giue the goodes only to good men, than
would folke take occasion to serue him *but* for them

Sir T. More, Comfort against Tribulation (1573), fol 35

If they kill us, we shall *but* die 2 Kl VII 4

Against his sharp steel lightnings
stood the Sullote *but* to die Whittier, The Hero

To the last two constructions, respectively, belong the
idioms "I cannot but hope that, etc." and "I can but hope
that, etc." The former has suffered ellipsis of the principal
verb in the first clause "I cannot do anything but hope,"
or "anything else than hope, or otherwise than hope,"
implying constraint, in that there is an alternative
which one is mentally unable or reluctant to accept, *but*
being equivalent to *otherwise than*. The latter, "I can
but hope that, etc." has suffered further ellipsis of the
negative, and, though historically the same as the former,
is idiomatically different. "I can only hope that, etc."
implying restraint, in that there is no alternative or op-
portunity of action, *but* being equivalent to *only*, not
otherwise than, or *no more than*

I cannot but remember such things were,
That were most precious to me Shak, Macbeth, IV 3.

I cannot *but*
Applaud your scorn of injuries
Beau and Fl., Laws of Candy, III 2.

his commonplace as fast only as he filled it Scott

Yet he could not *but* acknowledge to himself that there
was something calculated to impress awe, in the sud-
den appearances and vanishings of the masque De Quincey

In an interrogative sentence implying a negative answer,
can but is equivalent to *cannot but* in a declarative sen-
tence

Why, who *can but* believe him? he does swear
So earnestly, that if it were not true,
The gods would not endure him
Beau and Fl., Philaster, III 1

After *doubt*, or *doubt not*, and other expressions involving
a negative, *but* may be used as after other negatives, *but*
that being often used pleonastically for *that*

I doubt not *but* I shall find them tractable enough
Shak, Pericles, IV 6.

My lord, I neither can nor will deny
But that I know them Shak, All's Well, V 3

I doubt not but there may be many wise Men in all
Places and Degrees, but am sorry the effects of Wisdom

I do not doubt but England is at present as polite a na-
tion as any in the world Steele, Spectator, No 6.

There is no question *but* the King of Spain will reform
most of the abuses Addison, Travels in Italy

Hence the use of *but* with *if* or *that*, forming a unitary
phrase *but if*, unless, if not, *but that*, except that, un-
less (these phrases having of course also their analytical
meaning, with *but* in its adverbative use)

Gramer for gures I gon furste to write,
And beet hem with a bales but *gyf* thei wolde lerne
Piers Plowman (A), XI 132.

The phrase *but* that, often abbreviated to *but*, thus takes an extended meaning (a) If not, unless.

Bote Ich be holly at thyn heste, let honge me ellyas!
Piers Plowman (C), iv 149
(b) Except that, otherwise than that, that not. (1)
After negative clauses

An expletive *what* sometimes, but incorrectly, follows
Not but what I hold it our duty never to foster into a passion what we must rather submit to as an awful necessity

3. On the contrary; on the other hand the regular adversative conjunction, introducing a clause in contrast with the preceding

Coke's opposition to the Court, we fear, was the effect not of good principles, but of a bad temper
Macaulay, Lord Bacon

The statement with which the clause with *but* is thus contrasted may be unexpressed, being implied in the context or supplied by the circumstances

Of much less value is my company
Than your good words But who comes here?
Shak, Rich II, ii 3

Have you got nothing for me?—Yes, but I have
Sheridan

Sometimes, instead of the statement with which the clause with *but* is contrasted, an exclamation of surprise, admiration, or other strong feeling precedes, the clause with *but* then expressing the ground of the feeling

O, but this most delicious world, how sweet
Her pleasures rellish!
Quarles, Emblems, ii 13

Good heavens, but she is handsome!
Adam Smith

4. Than, after comparatives (This construction once in good use, and still common, is now regarded as incorrect)

It can be no otherwise but so
B. Jonson, Cynthia's Revels, v 2

O fairest flower, no sooner blown but blasted
Milton, Ode on D F I

I no sooner saw my face in it but I was startled by my shortness in it

isolated uses derived from the preceding]=Syn. However, Still, Nevertheless, etc. See however

Thus, the "Three Buttes" were a conspicuous landmark for emigrants to Oregon. One of the highest and grandest mountains in the United States, Mount Shasta, was in the early days of Californian migration known to the Americans almost exclusively as *Shasta Butte*. Other prominent lofty peaks in California are still called *buttes*, as Downsville Butte, Marysville Butte, etc. This use of the word *butte*, now gradually disappearing from the region in question, a relic of French occupancy of the Northwest, and of the subsequent wide distribution through that region of the Hudson's Bay Company's employees, most of whom were of French extraction. The word was picked up by overland emigrants and carried to the farthest West, and it has been much used as a place name, alone or in combination.

As prepared for use, it contains 80 to 85 per cent. of fats, with varying amounts of water and salt, and minute quantities of sugar and curd. It is used as a food or relish by most peoples, and is made directly from the milk, or from the cream previously separated from the milk, of cows, goats, and other animals. Agitation or churning separates the fats from the milk or cream and makes them cohere in lumps, which are then worked together, freed as far as possible from buttermilk, and usually mixed with salt, which preserves the butter and develops its flavor.

A Pertaining to Byzantium, or Constantinople, an ancient city of Thrace, situated on the Bosphorus, which became the capital of the Byzantine or Eastern empire, or to the empire itself. Byzantium was founded by a Greek colony in the seventh century B. C., but was of no great importance until A. D. 330, when the emperor Constantine the Great made it his capital, and changed its name to Constantinople, after himself. **Byzantine architecture**, a style of architecture developed from the classical under the Byzantine empire during the fourth and fifth centuries A. that empire by the Turks in A. D. 1453. It spread so widely that its influence even in Italy did not wholly decline before the fifteenth century, and it may be considered as surviving still in Russian architecture, and in a less marked degree in other eastern lands. An almost universal feature of the style, in buildings of any pretension, is the incrustation of brick or rough stonework with more precious materials, large spaces are left void of bold architectural features, to be rendered in

to rest merely by surface ornament of polished marbles presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline. The style depends much on color for its effect, and mosaics wrought on grounds of gold or of positive color are profusely introduced. The leading forms which characterize the Byzantine style are the round arch, the circle, the cross, and the dome supported upon pendentives. The capitals of the pillars are of endless variety, and full of invention. While some are plainly founded on the Greek Corinthian, many resemble those of early round arched western architecture, and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilica of St. Sophia, in Constantinople, and the church of St. Mark, in Venice, are classical examples of Byzantine architecture. — **Byzantine historians**, a series of historians and chroniclers of the affairs of the Byzantine empire, scattered through the whole period of its existence. They are our only source of knowledge of Byzantine history. Their works have been several times printed complete in the original Greek, the latest edition being by Niebuhr and others, in 48 volumes.

II. *n* 1 A native or an inhabitant of Byzantium. See I—2 [l. c.] Same as *bezant*, 1. **Byzantinism** (biz-'an- or bi-zan-'tin-izm), *n*. [*< Byzantine* + *-ism*] The spirit, principles, and methods of the Byzantines, especially with reference to literature and art; the manifestation of Byzantine characteristics.

Byzantinism regulated all forms of art by strictly conventional rules.
C. C. Perkins, *Italian Sculpture*, Int., p. 1.

C 1 The third letter and second consonant in the English, as in general in the other alphabets derived from the Phœnician. The value of the sign, however, in Phœnician as in Greek, was that of a hard *g* (in *go, gum*), and so also originally in Latin beside the sign *k* which had the proper *k* sound. But the Latins gave up for a time the written distinction of the *k* sound from the *g* sound writing both with the same character, *C*, and when later they re-adopted the distinction, instead of reducing *C* to its original value, and restoring *k*, they retained the *k* value for the *c*, and added a tag to the same character for the *g* sound, thus turning *C* into *G*. The comparative table of forms, like that given for the other letters (compare *A* and *B*), is as follows

𐤀	𐤁	𐤂	𐤃
Phœnician	Phœnician	Phœnician	Phœnician
𐤀	𐤁	𐤂	𐤃
𐤀	𐤁	𐤂	𐤃

Great as is the apparent difference between Greek *C* and our *C*, it is due only to a shifting of the position of the angle made by the two component lines and the rounding of this angle. The hard or *k* sound which belonged to this character in early Latin belonged to it also in Anglo-Saxon (which, like Latin, made little or no use of *k*). But this *k* sound as being a guttural or back palatal mute, is particularly likely to be shifted forward along the tongue and to be changed into front palatal and sibilant sounds, especially before vowels like *e* or *y* which favor the front palatal position. Hence it comes that *c* still so written is pronounced as *s* in English before *e* or *y*, and elsewhere as *k*. But this "soft" or sibilant *c* belongs to the French part of our language, the Anglo-Saxon when softened, gets the sound usually represented in English by *ch* and is so written for example in *church, chess, chicken, bare, teach* (See *ch* and *ambulation*). No word containing the phonetic *c* is of Anglo-Saxon origin except a few mispelled, as *under* and *over*, *truce*, *etc.*, *penet*, *meat*, etc., having *c* for original *ch*, *s* for *ch* for the sounds of *ch*, *s* or *ch*.

2 As a numeral, in the Roman system, *C* stands for 100, and is repeated up to *CCCC*, 400 (followed by *D*, 500). This symbol, originally *C*, that is the Greek theta (Θ), was afterward reduced to *C* and understood to stand for *centum*, a hundred.

3. As a symbol (*a*) In music (1) Used in English and German to designate the key note of the natural scale. See *natural* and *scale*. (2) When placed on the staff immediately after the clef, a sign of common time, each measure containing 4 quarter notes or their equivalent. When a vertical line is drawn through it, it indicates all breve time, each measure containing 2 or 4 half notes, played more quickly than in common time. (3) On the keyboard of the organ or pianoforte the white key or digital next to the left of each group of two black keys. The middle *C* of the keyboard is a usual starting point in the reckoning of both keys, tones, and notes, it is also known as *alto C* or *c*, the next *C* below is called *tenor C* or *c*, the second *C* below, *bass c*, or *C*, and the next *C* above, *treble C*, or *c*, etc. The present pitch of middle *C* is from 230 to 265 vibrations per second. It is often theoretically fixed in Germany at 264, in England at 256, and in France at 251. About 1700 it was actually about 240, and in recent times as high as 275. The major scale of *C*, because it comprises all the white keys and none of the black ones, is taken as the normal or standard scale of the keyboard. (b) In the mnemonic names of moods of syllogism, the symbol of reduction *per impossibile*. (c) In *math*, *C* is used to denote a constant of integration. See also *A*, *2* (*r*), (*d*), (*e*). (d) In *chem*, the symbol for carbon.

4 As an abbreviation, *c* or *C*, stands, in dental formulas of zoology (*c*), for *canine tooth*, in United States money (*c*), for *cent*, in thermometer-readings (*°C*), for *centigrade*, in French money (*c*), for *centime*, in references (*c*), for *chapter* (or Latin *capitulum*), in dates, before the number (*c*), for Latin *circa*, about, in metrology (*c*), for *cirrus*, in a ship's log-book (*c*), for *cloudy*, and in measures of volume (*c*), for *cubic*. — **Middle C**, in music, the note on the first ledger line above the bass or below the treble staff (See above).

-Syn. 4. Combination, Party, Faction, Cabal, Camarilla, Junta. Combination is the most general of these words, but it expresses least of permanence in organization, it often denotes the union for special ends of individuals or parties otherwise antagonistic as, the Democrats and Greenbackers entered into a combination to secure the election. A party is strictly a more close and permanent union of individuals organized to promote certain principles or common interests which they consider of fundamental importance as the Low Church party, the Republican party, but the term is more loosely used where organization is wanting, as the Free trade party. Combination and party may express that which is entirely reputable, the other words are chiefly unfavorable in the signification. A faction is commonly a section of a party, it is generally a comparatively small number of individuals, whose principles and objects are often of a capricious, frivolous, or selfish nature, but advocated so persistently as to be annoying, and with so little regard to the general interest as sometimes to be dangerous. Cabal and junta express a union less comprehensive than party or even faction. The intrigues of a cabal or junta are usually conducted mainly for the personal aggrandizement of its members. Junta has almost entirely given place to cabal in modern use. A camarilla is a more or less united body of secret counselors of a ruler, acting generally in opposition to his official advisers, and constituting a "power behind the throne."

After numerous abortive attempts and unsuccessful combinations in which Newcastle bore the chief part, it became evident that the union of Newcastle and Pitt was absolutely necessary

The cabala employed itself first in a mystic explanation of Deity and cosmogony, and in the creation of hidden meanings for the sacred Hebrew writings, thus drawing into its province all the Hebrew law and philosophy. Later cabalists pretended to find wonderful meanings even in the

letters and forms of the sacred texts, and made for themselves elaborate rules of interpretation.

The cardinal doctrines of the cabalists embrace the nature of the Supreme Being, the Divine emanations or Sephiroth, the cosmogony, the creation of man, psychology, the destiny of man and the universe, and the import of the revealed law. The cabalists seem to have endeavored to identify all such sciences as demonology, astrology, chiromancy, sympathetic medicine, etc., with their theosophic mysticism, weaving the whole into a secret universal wisdom or esoteric philosophy of the universe. They sympathized with many points of Christianity so that in the fifteenth and sixteenth centuries the cabala was by many thought highly important as a proof of Christianity and as a means of converting the Jews.

The *Cabalists* had a notion, that whoever found out the mystic word for anything attained to absolute mastery over that thing. Lowell, Among my Books, 1st ed., p. 158

Hence—4. An executive council, the select council of a sovereign or of an executive government; the collective body of ministers who direct the government of a nation or country. In Great Britain, though the executive government is vested nominally in the crown, it is practically in a committee of ministers called the *cabinet*, which is of comparatively modern development. Every cabinet includes the First Lord of the Treasury, who is generally chief of the ministry, or prime minister, the Lord High Chancellor, the Lord President of the Council, the Chancellor of the Exchequer, and the five Secretaries of State, with two or more other members, at the prime minister's discretion. In the United States the *cabinet* is a collective popular name, not recognized by law, for the heads of the eight executive departments, namely, the Secretaries of State the Treasury,

War, the Navy, the Interior, and Agriculture, the Postmaster General, and the Attorney-General. They are appointed by the President, by and with the advice and consent of the Senate, and are removable at the President's pleasure. They have as a body no legal functions, but by custom meet the President at stated times for consultation. The term *cabinet* is also sometimes applied to the executive council of a governor or of a mayor.

In certain parts of Europe these are arranged in a frame, and hung upon the wall of a church, after the funeral. — **Kitchen Cabinet**, in *U. S. hist.*, a collection of intimate friends of President Jackson generally supposed to have more influence with him during his presidency (1829-37) than his official advisers, so called in allusion to their private and familiar status, as if admitted to the White House through the kitchen.

The insulating layers are generally separated from the outer wires by a padding of jute or hemp saturated with tar or other protective substance. Broken cadence, in music, an interrupted cadence—**False cadence**, the closing of a cadence in another chord than that of the tonic preceded by the dominant—**Half cadence**. Same as *imperfect cadence*. Also called *half close*—**Perfect, complete, or whole cadence**, the chord of the dominant followed by that of the tonic, also, the chord of the dominant seventh followed by that

of the tonic. These two forms of the perfect cadence were in ancient church modes called *authentic*, in distinction from the *plagal* cadence. An example of each form in C major is here given. The end of a piece should properly be a complete cadence, incomplete and interrupted cadences being suitable only as temporary endings for phrases or periods in the midst of a piece—**Imperfect cadence**, the chord of the tonic followed by that of the dominant, it rarely occurs as a final close—**Interrupted or deceptive cadence**, a cadence formed by a chord foreign to that which was expected, thus evading the close and deceiving expectation. Thus, in the example, the second chord has A in the bass instead of C, which is naturally expected. Also called *suspended cadence*—**Medial cadence**, a cadence in ancient church music in which the mediant was the most important note—**Mixed cadence**, a cadence in which a subdominant is followed by a dominant, and this by a tonic chord, so called from its being a combination of the authentic and plagal cadences of ancient church music—**Plagal cadence**, a cadence which con-

2 In *her*, the relative status of younger sons

Also *brisure*—**Marks of cadency**, in *her*, bearings used to distinguish the shields of the second son, the third son, etc. This is sometimes effected by a bearing differing only in details on the shields of the different sons, as a label having three, four, or more points, to mark their respective order. It is also effected by means of a totally different bearing. Thus, in modern times it has been ordained that the eldest son should wear a label during the lifetime of his father, or until he inherits the paternal shield, without marks of cadency, the second son a crescent, the third a mullet, the fourth a martlet, the fifth an annulet, the sixth a fleur-de-lis, the seventh a rose, the eighth a cross moline, the ninth a double quatrefoil. The mark of cadency may become a permanent part of the shield if the younger son acquires estates of his own and builds up a family of consequence, thus the bordure, which is originally a mark of cadency, has often become a permanent bearing, and the shield which contains it bears now marks of cadency when borne by the sons of its possessor

cadenza (ka-den'zā), *n.* [*It see cadence*] In music, a more or less elaborate flourish or showy passage introduced, often extemporaneously, just before the end of an extended aria or concerto, or as a connective between an intermediate and a final division. It is always intended to display the technical proficiency of the performer, and to arouse wonder and applause, and hence, except in the hands of a master, is often deficient in intellectual or expressive character, as well as incongruous with the remainder of the piece. Modern composers, therefore, usually write out cadenzas in full, instead of trusting, as was customary in the seventeenth and eighteenth centuries, to the taste and readiness of singers and players. cadmium (kad-mi-um), *n.* [*NL*, < *L. cadmia* see *cadmia*.] Atomic weight, 112.3, chemical symbol, Cd. A metal discovered by Stromeyer in 1817, resembling tin in color and general appearance, and, like that metal, having a "cry" when bent. The specific gravity of the cast metal is 8.62, of the rolled, 8.69. Its hardness is between that of gold and tin, and it is easily rolled to sheets or even to very thin foil. It fuses at about the same temperature as tin, 467° F., and communicates to various alloys the property of fusing at very low temperatures. (See *Wood's metal*, under *metal*.) If 8 to 10 per cent of cadmium be added to Rose's metal, its fusing point is lowered to 167°. Cadmium is a common accompaniment of zinc ores, both blende and calamin, and it is in the smelting of these

that the commercial metal is obtained, which is done almost exclusively in Silesia and Belgium. Some kinds of blende contain as much as 3 or 4 per cent of sulphid of cadmium. This metal also occurs by itself naturally in combination with sulphur, forming the rare mineral called greenockite (which see). The manufactured sulphuret is of importance as furnishing a brilliant and permanent yellow color called cadmium yellow (see below). This is used by artists, also in coloring soap and to some extent in call coloring. It is also used for giving a yellow luster to the surface of porcelain. The total produce of cadmium is supposed to be about two tons a year — *Cadmium blende*, the mineral greenockite

Later the fillets were changed to serpents, and in the conventional representations familiar at the present day the caduceus is often winged. The caduceus is a symbol of peace and prosperity, and in modern times figures as a symbol of commerce. Mercury being the god of commerce. Cæciliidæ (sē-si-l'i-dē), n pl [NL, < *Cæcilia* + *-idæ*] A family of serpentiform amphibians having no limbs, nor even pelvic or pectoral girdles. They are covered with small scales embedded in ring like folds of the skin or are naked, their eyes are generally rudimentary or concealed, their anus is terminal, and they have gills in early stages of development. The vertebrae are amphicoelous and the notochord is persistent. There is no sternum, the ribs are short and very numerous, the tongue is short and fleshy, and the teeth are sharp and recurved. The family alone constitutes an order variously named *Ophiomorphia*, *Gymnophiona*, *Pseudophidia*, *Apoda*, etc. It contains 14 genera. *Cæcilia* is the principal one, occurring in South America. 5 others are South American, 3 Asiatic, and 1 African. More than 30 species are known. Some of the *Cæciliidæ* attain a length of several feet, they burrow in the ground, and sometimes take to the water. According to some, they live on vegetable matter, according to others, upon worms and insect larvae. Often, but erroneously, spelled *Cæcididæ* also *Cæciliadæ*, *Cæcididæ*

It is scarcely more than a rudiment or vestige of the corresponding large formation of some animals. See cut under *intestine*

2 In *zool*, any cecal diverticulum or intestinal appendage ending in a cul-de-sac. See cuts under *Asterodonta* and *uk bag*. In mammals there is but one cæcum, sometimes of enormous extent, as in the ruminants and herbivorous species generally. It is given off from the colon at the point where the small intestine enters it. In birds there are usually two cæca, sometimes one cæcum, attaining great size in some cases, as of the herbivorous geese, sometimes none. There being no obvious distinction between the ileum and the colon in birds, the site of the cæca or cæcum is taken as the beginning of the colon. In fishes cæca are often numerous and large. A cardiac cæcum forms a prolongation of the cardiac end of the stomach in the blood sucking bats of the genus *Desmodus*
